

SmartCARS3 Tutorial

1. Download/Install the smartCARS 3 client from the link in your pilot center
2. Open it and say fly with a community
3. Select Virtual Northwest Airlines

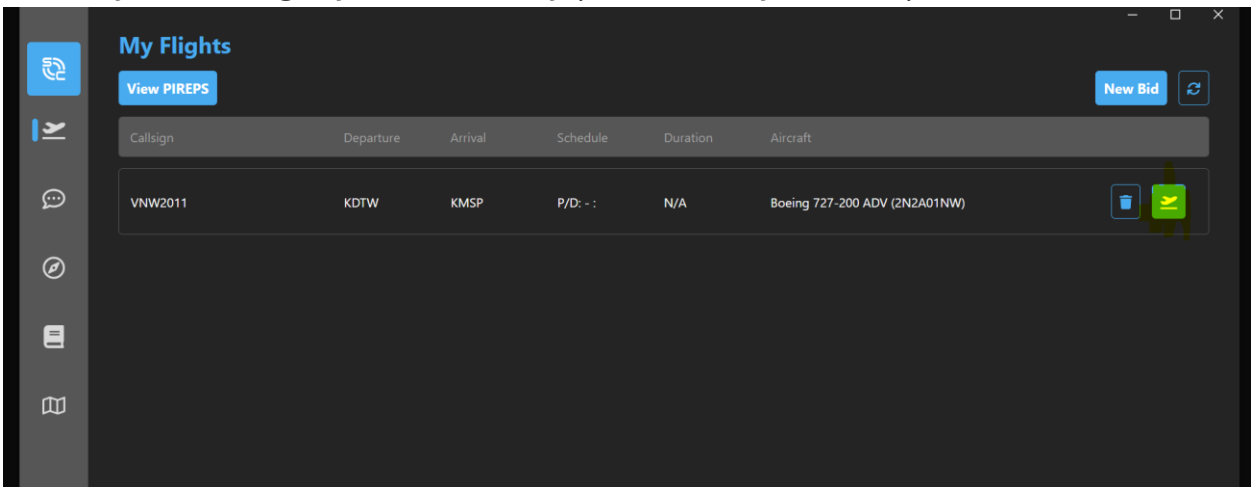

4. Follow the setup instructions and it will make a shortcut right to our airline on your desktop (if selected)
5. **We ask that you go into settings and change your weight units to LBS, altitude units to FT, and landing distances to FT. This just helps ensure similar data across our PIREPS.**

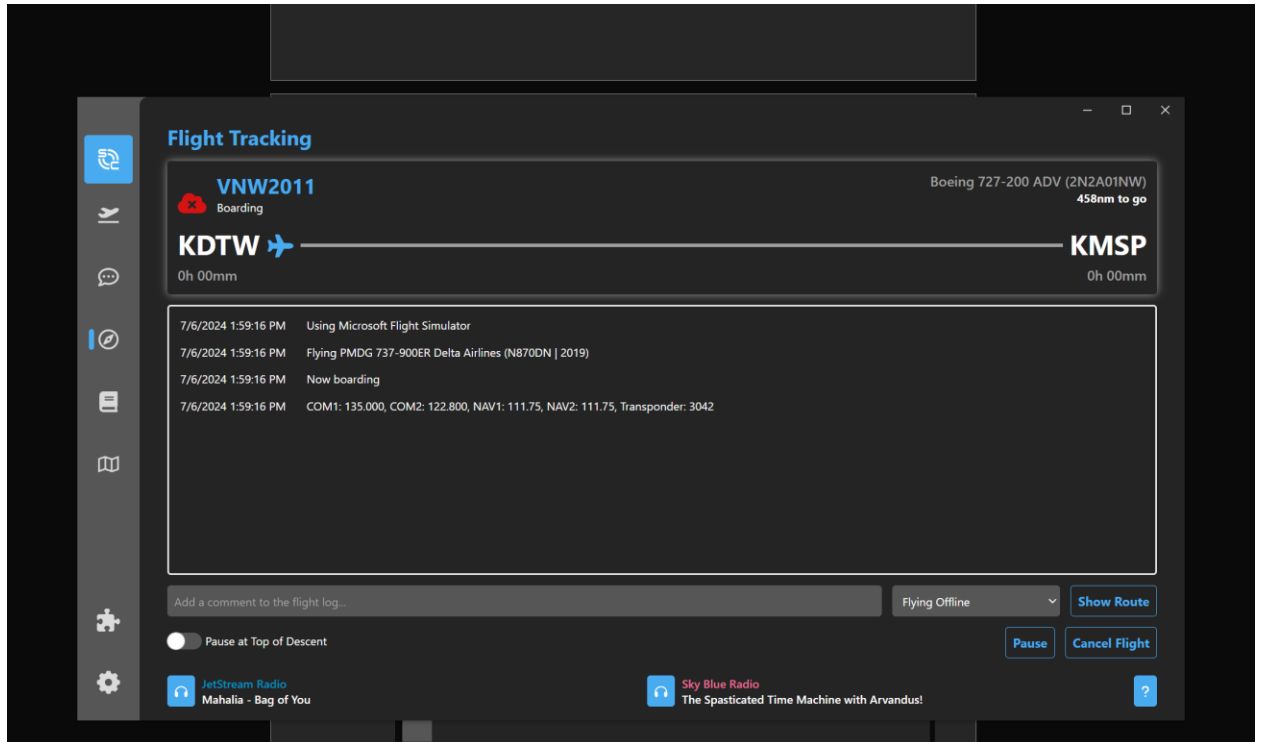

6. Click the flight button

7. Click fly on the flight you want to fly (must be in your bids)

8. You may enter your route by clicking show route and putting it in the bottom left textbox. Click show comment to change it back to a comment text box
9. You may select the network that you are flying on in the drop-down in the bottom right

10. Don't worry about your cruise altitude. SmartCARS 3 will figure it out on it's own.
11. Upon arrival once your engines are shutdown your PIREP will be automatically filed and you may close smartCARS, or fly again.
